

ABSTRACT OF THE DISCLOSURE

A display section A and a body section B including a CPU and serving to carry out a signal processing are connected to each other through a folding section C. The display section of a folding portable apparatus is provided with a display panel 2, a camera 3 and image processing means 27 for receiving photographed image data from the camera, carrying out an image processing and directly supplying display image data to the display section. In the case in which data including the image data are to be supplied from the body section to the display section or from the display section to the body section, a data transmitting/receiving function between the CPU and the image processing means is enabled.
